

Company Name: Fitwell Buckle Co.

Business Model:

Our company manufactures and sells precision micro-adjust watch buckles through our e-commerce store at fitwellbuckle.co (powered by Shopify). We sell directly to consumers and through wholesale partnerships with watch brands including Junghans, Delugs, and 5280 Watch Co. We advertise our products through Google Ads (Account ID: 293-513-7197) managed under Manager Account 272-385-8162. We only advertise for our own business and do not manage ads for anyone else.

Tool Access/Use:

Our tool is an internal admin dashboard hosted at admin.fitwellbuckle.co, used by 3 employees within our company (the CEO, a co-founder, and a technical advisor) to view and analyze ad performance alongside our Shopify order data. The tool is read-only — it pulls campaign metrics from the Google Ads API to display in our analytics dashboard. No external users or agencies have access to the tool. The tool does not create, modify, or manage ads — it is strictly for reporting and attribution analysis.

Tool Design:

Our internal Next.js application pulls daily campaign-level metrics from the Google Ads API into our PostgreSQL database (hosted on Neon). A scheduled cron job runs daily at 06:45 UTC to extract the previous day's campaign data. Our admin dashboard UI then queries this local database to display campaign performance metrics alongside our e-commerce order data from Shopify, enabling us to calculate true ROAS by cross-referencing ad spend with actual revenue.

Our database stores: campaign name, campaign ID, date, impressions, clicks, cost (converted from micros to cents), conversions, and conversion value — aggregated at the daily level per campaign.

API Services Called:

- GoogleAdsService.SearchStream — to query campaign performance metrics using GAQL (Google Ads Query Language). This is the only API service we call. Read-only access only. No mutations or ad management.

GAQL Query:

```
SELECT campaign.name, campaign.id, segments.date, metrics.impressions, metrics.clicks,
metrics.cost_micros, metrics.conversions, metrics.conversions_value FROM campaign WHERE
segments.date = 'YYYY-MM-DD' AND campaign.status != 'REMOVED'
```

Tool Mockups:

Below is a screenshot of our actual admin dashboard showing the Campaigns & Traffic page. It displays GA4 session metrics, a traffic breakdown by source/medium, and the Google Ads Campaigns section (currently awaiting API access to populate with campaign data).
